

Caution on Draining Pool

Above ground pools should never be completely drained unless the liner is being changed or when extreme circumstances such as repairing the sand bottom require it and then only if the liner is being immediately refilled within an hour or so. When a liner is emptied of water, it starts to shrink and will not stretch back into place again like it did on installation. This will cause it to tear, pull off of the wall, or pull down the wall. Liners should *never* be drained below a foot of water. The amount of backfill up against the pool wall should also be considered when contemplating draining a pool. The water should never be lower than the backfill level. It is never recommended to drain a pool to clear a green pool.

Family Leisure is not responsible for damage done to a liner or pool structure due to draining a pool.
